Re: Vibration Monitoring Summary
Willow Estates Flood Berm
Drumheller, Alberta

Dear Mr. Strukoff.

1.0 INTRODUCTION

The Drumheller Resiliency and Flood Mitigation (DRFM) Office is constructing or upgrading several flood berms for communities in the Town of Drumheller, Alberta. The DRFM Program includes the upgrade of the existing flood berm around the neighborhood of Willow Estates in east Drumheller. The Willow Estates Flood Berm project is being designed and managed by WSP E&I Canada Limited. (WSP); acting on behalf of the DRFM Office. The construction work has been contracted to Wilco Contractors Southwest Ltd. of Calgary, Alberta. ParklandGEO Ltd. (ParklandGEO) was contracted by WSP to provide vibration monitoring during the berm construction. undertaken in the Fall of 2022 and Spring of 2023. The following is the summary report of the vibration monitoring program.

2.0 VIBRATION AND NOISE MONITORING PROGRAM

2.1 SCOPE OF WORK

The vibration monitoring program for this project consisted of four components:

1. **Pre-Construction Inspections.** All owners of structures within 30 m of the proposed construction area were offered inspections to document the condition of the interior structures and finishes prior to construction. This inspection included recorded visual observations and photographs. This program was provided on an owner opt-in basis.

2. **Ongoing Construction Vibration Monitoring.** Ground vibration monitoring was undertaken at Willow Estates Flood Berm during the construction period to document and control the risk of potential structural damage to nearby structures and infrastructure due to vibration level during construction activities. Field data for vibration and noise monitoring and was collected during the construction activities in Fall of 2022 and Spring of 2023.
3. **Investigation of Concerns During Construction.** The DRFM Office maintained a communication log with the local residents. Concerns and complaints about construction vibration impacts registered from Willow Estates residents were relayed to WSP and ParklandGEO for investigation. Typical investigation activities included moving monitoring equipment to the site and visual inspection of the structures for potential impacts and damage related to construction activities. Individual investigation comments were provided to each resident that registered a concern.
4. **Post-Construction Inspections.** Post-construction inspection were undertaken for all structures where owners had registered a concern about construction vibration area; and a consented to the inspection. This inspection included recorded visual observations and photographs, focusing on the areas of concern with comparisons pre-construction inspection and construction investigation information where available. Individual responses were provided to each resident that registered a concern.

2.2 MONITORING SETUP AND EQUIPMENT

The equipment used for vibration and noise monitoring were 8 Channel Instantel Blastmate III vibration monitoring devices (Blastmate), capable of taking readings from two separate geophones at the same time. This equipment provides a continuous reading of peak particle velocities (PPV) and frequencies. PPV readings are taken and recorded to the Blastmate memory every 5 seconds. The recorded vibration data is then downloaded at the end of construction each day. The devices were also fitted with microphones, which allowed for noise monitoring of peak sound intensities.

During the construction activities at Willow Estates Flood Berm project in the Fall of 2022 and Spring of 2023, one to three Blastmate units were used to continuously monitor the peak particle velocities (PPV) during all periods of construction activities. The geo-phones were set up at representative locations and varying distances away from the construction activities. In most cases the sensors were placed closer to the construction than the nearest building. In some specific cases monitors were set near structures as part of the investigation process related to resident concerns. A summary table for the vibration and noise monitoring results for Fall of 2022 and Spring of 2023 is attached to this letter.

The purpose of vibration monitoring programs was not to determine the level of vibration being experienced at any given house or commercial structure. Each day the monitoring equipment was set up at representative sites to measure vibration levels at two points between the nearest structure and the construction activity. The distances were varied day-to-day to provide data on the relationship between vibration and distance from the source.

2.3 MONITORING CRITERIA

Vibration monitoring measures the peak particle velocity (PPV) and frequency of vibration related to nearby construction activity such as, pile driving, excavation and subgrade compaction. The PPV is measured by the Blastmates in the transverse, vertical and longitudinal directions. Vertical amplitude is generally representative of the vibration in all three directions and is often used to assess potential vibration damage. Alternatively, the largest of the three perpendicular PPV components could be selected. For the purposes of this review the largest of the three perpendicular PPV components is summarized. The PPV is plotted against the frequency of the vibration. The typical range of frequency for the construction activities on this project was between 10 Hz and 30 Hz.

The Town of Drumheller does not have a specific vibration monitoring criteria for structural damage related to construction activity. For the purposes of vibration monitoring the vibration thresholds used for this project were developed by the United States Bureau of Mines: Office of Surface Mining, Reclamation and Enforcement (OSMRE) were used. These thresholds were developed from studies of building damage due to vibration from blasting at mines. The OSMRE thresholds from the OSMRE Guidelines are provided on Figure 1. This plot format has also been used for presentation of all Blastmate data on this project.

During the investigation of registered resident concerns, the construction vibration criteria promoted by Federal Transit Administration (FTA 2018) was also consulted. The FTA criteria provides PPV vibration limits for four different building categories. The most applicable building category for the typical houses in Willow Estates was “Non-Engineered Timber and Masonary Building” which had a construction threshold of 5.1 mm/s for all frequency ranges.

It is important to understand that all vibration criteria are basically opinions on threshold values for the purposes of reporting and monitoring construction activity. The typical criteria are inherently conservative since they are intended to identify and avoid activities that could result in damage to nearby structures and infrastructure before the structures experience damage. Exceeding these thresholds does not imply that either cosmetic or structural damage should be expected. This is especially true for occasional exceedances which are typical to the construction process and usually attributed to non-construction related activities (e.g. moving and inadvertently bumping monitors).

Even when vibration levels are not severe enough to cause cosmetic or structural damage, they can cause negative human responses which may result in complaints. Observed movement of wall hangings and vibrating of dishes in cupboards related to nearby construction activity, without accompanying signs of damage (i.e. cracks) is not a sign that cosmetic damage is occurring.

3.0 VIBRATION AND NOISE MONITORING DISCUSSION

3.1 GENERAL VIBRATION OBSERVATIONS

The observed ground vibration amplitudes expressed in terms of PPV reduced as the distance from the construction increased. The exceptions to this observation were localized, anomalous readings that were caused by disturbance or non-construction related vibrations from other sources near the sensor. A typical anomalous disturbance would be moving or accidentally bumping the Blastmate. These unusual disturbances were typically isolated (i.e., not sustained) and can be easily identified on units with two geophones, when a large spike in vibration is only observed on one of the two geophone sensors. Another kind of event can result in anomalous reading is when work take place closure to the sensor than expected as the set back distances shown in Chart 1 are referenced to the berm. Activities occurring closer to a sensor can produce large readings that quickly dissipate and are expected to be non-damaging to the surrounding structures. Vibratory compaction and construction activities between sensors spaced 3 m apart typically experience a 30 to 50 percent reduction in PPV. Suspected anomalous disturbances have much larger reductions of PPV between sensor in the order of 75 to 90 percent.

Chart 1 provides a summary of the recorded maximum daily directional PPV versus horizontal distance from construction activities excluding those reading believe to be caused by sensor disturbances.

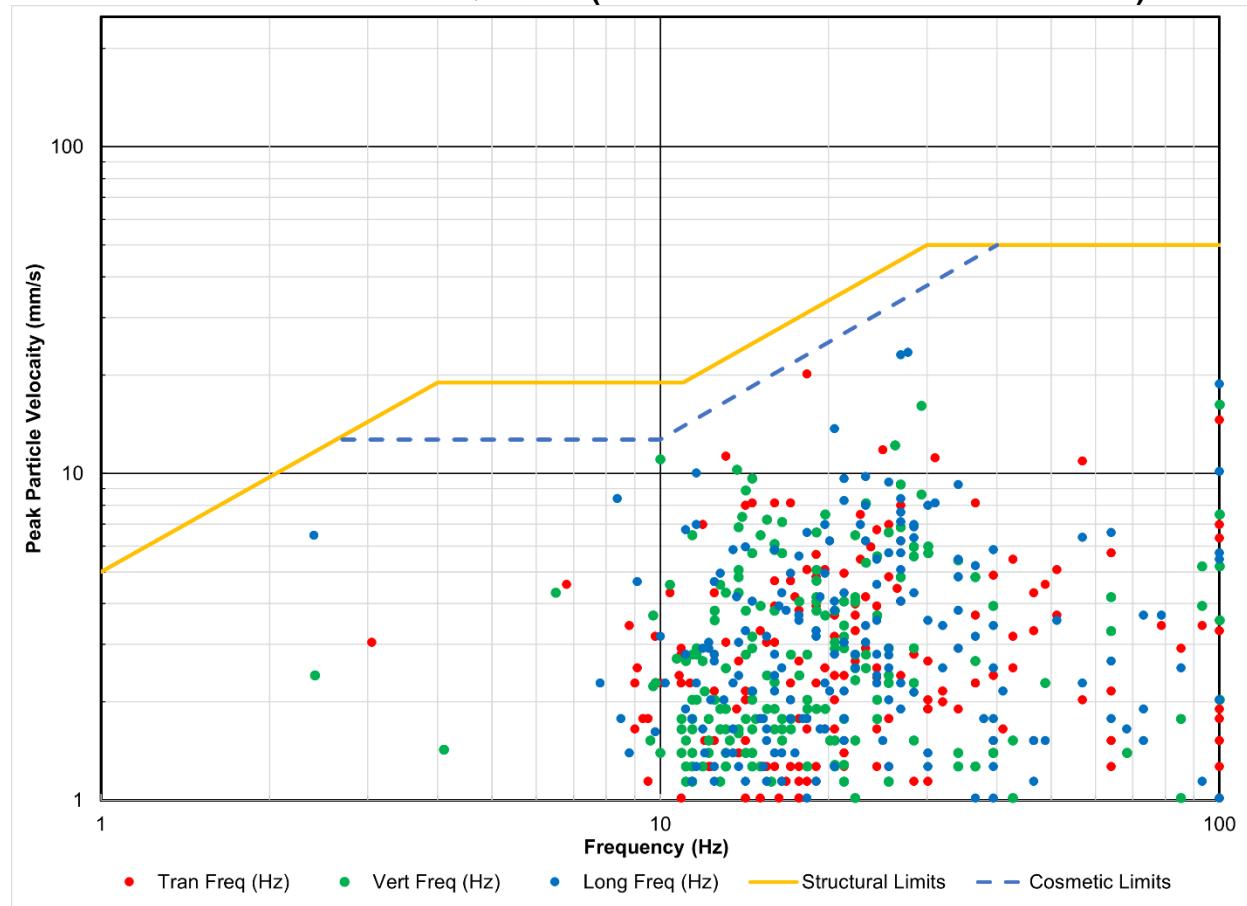

CHART 1 – MAX PPV VS DISTANCE (EXCLUDING KNOWN DISTURBANCES)

This data has been corrected to remove suspected or verified anomalous readings. The chart also shows the theoretical expected PPV for vibratory compaction equipment for various distances calculated based on the method described in the FTA Guide. This distribution shows a relatively good relationship between the theoretically expected PPV and actual vibration versus distance from operating vibratory compaction equipment.

Chart 2 shows the highest daily measured PPV values from all three perpendicular directions (longitudinal, transverse, and vertical) graphed against the vibration frequency and the threshold limits given by USBM and OSMRE.

CHART 2 – PPV VS FREQUENCY (EXCLUDING KNOWN DISTURBANCES)

Out of 750 data readings during the construction period, there were 22 data records of PPV exceeding 25.4 mm/s and 28 records of PPV exceeding 12.5 mm/s. These large vibrations were considered to be caused by disturbances to the sensor based on the isolated occurrences and comparison to the PPV recorded in the second sensor which was usually 3 to 3.5 m away. Once the suspect disturbances are removed, the PPV values for the project fall within OSMRE limits. Almost all PPV readings taken from monitoring points at least 10 m from the construction vibration source below 5 mm/s. The following additional comments are provided for consideration:

1. In general, the highest vibrations were recorded nearest to the berm toe with peak PPV values decreasing below 5 mm/s at a distance of about 10 m from the berm toe.

2. On some days the geophones may be closer to houses, but general observations and data review verified vibration levels experienced by any given structure was less than the vibration level measured on the closest geophone located nearer to the construction.
3. The house structures adjacent to the construction area in Willow Estates were located an average of 13 m from the boundary of the construction area. The vibration levels resulting from the construction activities at the Willow Estates Flood Berm project in the Fall of 2022 and Spring of 2023:
 - would have been noticeable in the adjacent houses.
 - Could have periodically been at levels high enough to cause cosmetic damage in some of the most sensitive structures; and,
 - were unlikely to have been high enough to cause structural damage in any of the houses.

It should be restated that the reported values in the Charts above and the attached summary table are the peak values from the date of recording. Detailed vibration data for any specific date can be provided, upon request.

4.0 INSPECTION AND INVESTIGATIONS

As a part of this vibration monitoring program pre-inspections were performed for 16 house structures in Willow Estates. Between the beginning and end of construction period 6 houses were subject to investigation to address logged resident concerns about construction vibration impact on their houses. Investigation information and/or post construction inspection letters were requested for the following addresses:

- 2 Willow Point
- 10 Willow Point
- 20 Willow Point
- 24 Willow Point
- 30 Willow Point
- 32 Willow Point
- 34 Willow Point

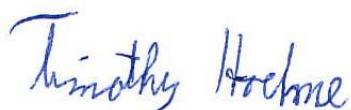

Additional information can be provided upon request.

5.0 LIMITATIONS AND CLOSURE

This vibration monitoring summary report is based on the field observations and vibration and noise monitoring program undertaken during the construction activities for the Willow Estates Flood Berm project located in Drumheller, Alberta. This report has been prepared for the exclusive use of **The Town of Drumheller, the Drumheller Resiliency and Flood Mitigation Office, WSP E&I Canada Limited** and their approved agents for the specific application of vibrations and noise monitoring for the proposed Willow Estates Flood Berm project in Drumheller, Alberta. Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. This report has been prepared in accordance with generally accepted engineering practices. No other warranty is made either express or implied.

We trust that this report meets with your current requirements. If there are any questions, please contact our office.

Respectfully submitted,
PARKLANDGEO LTD.
